

## Introduction to Dairy Nutrition

Mark McGuire  
AVS Dept.  
University of Idaho  
Fall 2009

---

---

---

---

---

---

---

---

## Dairy Nutrition

- Considerations
  - Nutrient requirements
  - Nutrient content of feeds
    - » Sampling for accuracy
  - Processing of feeds
  - Cost of feed
    - » Availability
    - » Contracting
  - Management style
  - Data evaluation

---

---

---

---

---

---

---

---

## Understanding Dairy Nutrition

- Nutrients
- Dietary formulation
  - Sampling feed ingredients
- Feeding management
- Cow observation

---

---

---

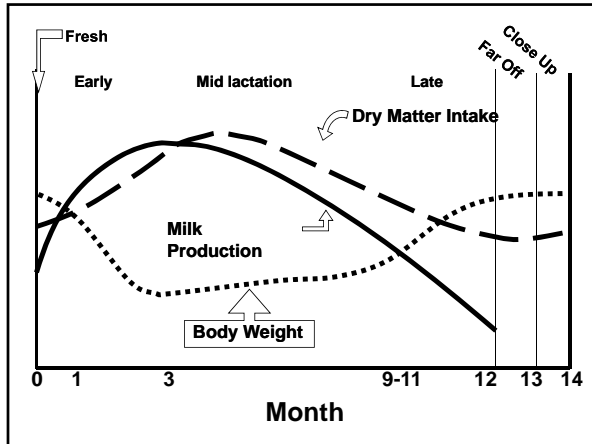

---

---

---

---

---

---

---

---

---

---

---

---

---

## Nutrient Requirements (NRC)

- ❖ Nutrient needs of animal
  - Based on body weight, milk production, milk fat content, pregnancy and growth
- ❖ Feed tables with "book" values
  - Nutrient content of feeds

Nutrient Requirements of Dairy Cattle  
Ninth Revised Edition, 2001

Developed by the Dairy Cattle Nutrition Committee of the National Research Council of the National Academies of Sciences, Engineering, and Medicine

National Academy Press  
Washington, DC

---

---

---

---

---

---

---

---

## Milk Rules of Thumb

- Peak
  - 30 to 70 days postpartum
    - » Second month on DHI test
      - Heifers (1<sup>st</sup> lactation) possibly later
  - Peak times 200 equals lactation total potential
    - » Example: 100 # X 200 = 20,000#
- Persistency
  - 1<sup>st</sup> lactation cows drop 6% per month after peak
  - Older cows drop 9% per month after peak

---

---

---

---

---

---

---

---

### Nutrition Based on Dry Matter

Dry matter = as fed x % dry matter

Dry matter % =  $\frac{\text{dry matter}}{\text{as fed}} \times 100\%$

Dry matter intake is always less than as fed intake!

---

---

---

---

---

---

---

---

### Dry Matter Intake Guides

Dry Cows: **(B.W. x .0185)**  
13 pounds of DM for maintenance

Milk Cows:  
**(.0185 x B.W.) + (.305 x lb 4% FCM)**  
**4% FCM = (0.4 X lb Milk) + (15 X lb Fat)**  
1 lb of DM ↑ milk yield 2 - 2.5 lb

---

---

---

---

---

---

---

---

### NRC Dry Matter Intake

Milk Yield lb (4% FCM)	Body Weight in pounds			
	880	1,100	1,320	1,540
44	_____ lb DMI per day _____			
66	_____ lb DMI per day _____			
88	_____ lb DMI per day _____			
110	_____ lb DMI per day _____			
132	_____ lb DMI per day _____			

---

---

---

---

---

---

---

---

### Changes in Nutrient Requirements

Body Wt + Milk (3.5%)	NEL (Mcal)	CP (lb)	Ca (lb)
1400 lb BW	10.12	0.932	0.057
1400 lb BW + 60 lb/d	10.12 + 18.6 = <b>28.72</b>	0.932 + 5.04 = <b>5.972</b>	0.057 + 0.18 = <b>0.237</b>
1400 lb BW + 150 lb/d	10.12 + 46.5 = <b>56.62</b>	0.932 + 12.6 = <b>13.532</b>	0.057 + 0.45 = <b>0.507</b>

---

---

---

---

---

---

---

---

### Dilution of Maintenance Costs (% of nutrient for milk)

Body Wt + Milk (3.5%)	NEL (Mcal)	CP (lb)	Ca (lb)
1400 lb BW	10.12	0.932	0.057
1400 lb BW + 60 lb/d	28.72 <b>(64.8%)</b>	5.972 <b>(84.4%)</b>	0.237 <b>(75.9%)</b>
1400 lb BW + 150 lb/d	56.62 <b>(82.1%)</b>	13.532 <b>(93.1%)</b>	0.507 <b>(88.8%)</b>

---

---

---

---

---

---

---

---

### Energy Sources

- Carbohydrates (Fermentable)
  - Fiber (Cell wall)
    - » Cellulose, hemicellulose
  - Non-Fiber (Cell contents)
    - » Starch, sugars
- Fats and Oils (Not fermentable)

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**ADF**  
(Acid Detergent Fiber)

- \* Lignin and cellulose
- \* Cell wall of the plant
- \* Digestibility is lower
- \* Increases as plant matures
- \* Predicts energy level

---

---

---

---

---

---

---

---

**NDF**  
(Neutral Detergent Fiber)

- \* Total cell wall
- \* ADF + hemicellulose
- \* Modest digestibility
- \* Dry matter intake control
- \* Increases as plant matures

---

---

---

---

---

---

---

---

## Total Digestible Nutrients (TDN) Expressed as % or lb

- Older system; moving to each "nutrient" needs
- Digestible Protein (70%)
- Digestible Crude Fiber (30 - 40%)
- Digestible Nitrogen Free Extract (80%)
- Digestible Ether Extract (60 - 80%) X 2.25

---

---

---

---

---

---

---

---

## Net Energy Basis Expressed as Mcal/lb

- Net Energy Maintenance       $NE_M$
- Net Energy Lactation         $NE_L$
- Net Energy Growth           $NE_G$

---

---

---

---

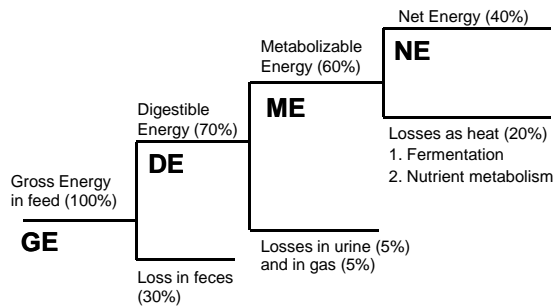

---

---

---

---

**Partitioning of ration (60% Alfalfa & 40% Corn) energy and losses in a lactating cow**

### Net energy system

---

---

---

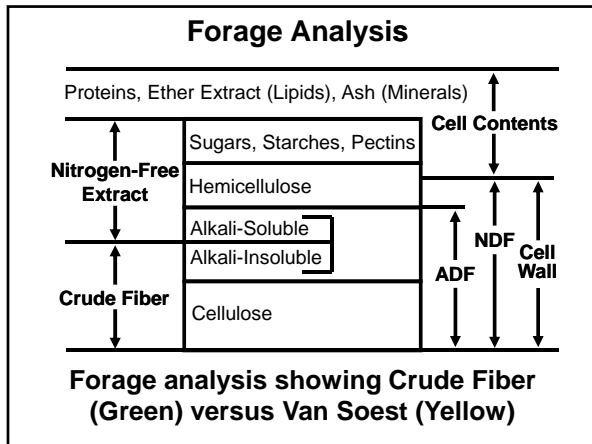

---

---

---

---

---

---

---

---

---

---

---

---

---

**Protein**

---

---

---

---

---

---

---

---

**Total Crude Protein**

- CP = Nitrogen (N) x 6.25
- 100 lb CP = 16 lb N
- 100 / 16 = 6.25
- Example: Alfalfa hay =  
3% N x 6.25 = 18.75% CP

---

---

---

---

---

---

---

---

### Available Protein

- Protein available for digestion
- Should be 90% or more of CP
- Less than 90% CP available indicates:
  - Heat damage
  - Excessive maturity at harvest

---

---

---

---

---

---

---

---

### Unavailable Protein

- Protein unavailable for digestion
- Should be less than 10% of CP
- If greater than 10% of CP indicates:
  - Heat damage
    - » Malliard Reaction
    - » Carmelized protein
      - Pay attention to distillers grains and other heated protein sources
  - Bound protein
  - ADF-N (ADIN)

---

---

---

---

---

---

---

---

### Avoid Heating & Carmelization in Silages

- Proper stage of maturity
- Correct moisture content
  - Oxygen-limiting (45 - 50%)
  - Conventional (55 - 60%)
  - Bunkers & bags (65 - 70%)
- Length of chop
- A tight silo or pack well
- Fill rapidly
- Seal if needed

---

---

---

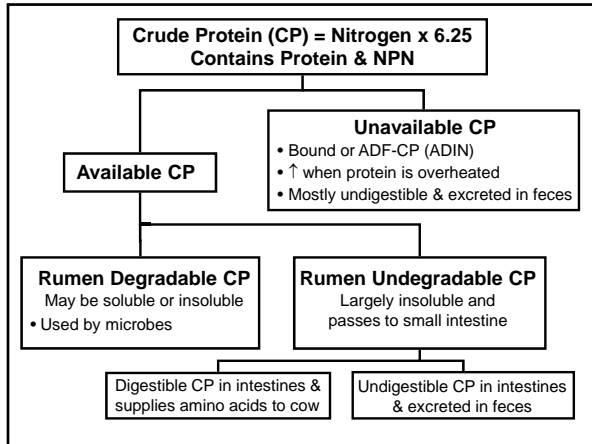

---

---

---

---

---

---

---

---

---

---

---

---

---

**Nonprotein Nitrogen (NPN)**

- N not in a protein
- True protein is N in a long chain of amino acids
- NPN must be incorporated into microbial protein to be beneficial
- Examples of NPN
  - Urea
  - Monoammonium phosphate
  - Free amino acids

---

---

---

---

---

---

---

---
